Bergland-Parkett - THE ORIGINAL

2-strip plank flooring

Klassiker - Trend Epoca - Trend Colour

1-strip country house flooring

Auslese - Wohngefühl - Design
Flair - Ambiente - Emotion - Vintage
Bergland-Parkett - best quality, convincing optics and the finest quality of the wood, selected from experts according to precise and elaborate selection criteria, lend elegance and grace to the parquet, for the highest demands and quality of living.

Surfaces

Oil | wax or Bären-quality-sealing

Perfect surface sealing is the best protection and a guarantor for the lifetime of a parquet floor. Bergland-Parkett surface sealings provide the best preservation for your parquet floor. Depending on the field of use, Bergland-Parkett offers a broad range of surface treatments that shape the appearance of the wood and provide for a healthy living.

Solid and pre-finished

Due to the exceptional and award-winning construction of Bergland-Parkett, it has been possible to reduce swelling

and shrinkage coefficients by up to 70% compared to solid wood. Due to the massive construction and the fact, that the parquet is well laid out, a substantial improvement of the sound insulation is achieved.

Underfloor-heating

With the exception of one wood type (beech natural), all Bergland-Parkett floorings are suitable for installation on radiant floor heating, given that the specific laying instructions of the manufacturer are observed. The special 3-layer-construction considerably improves the thermal conductivity of floor heating systems.

Maximum safety

According to legal guidelines and requirements, Bergland-Parkett flooring fulfills the criteria of the classification „Cfl-s1“ flame retardant and low smoke emission. Thus, Bergland-Parkett meets the regulations applying to property constructions and attic extensions.

Frontside gluing of plank flooring

Bergland-Parkett's special production techniques allow both „alongside gluing“ and „frontside gluing“ of 2-strip plank flooring elements. Hence, an essentially higher protection against invasive moisture and the highest possible stability result and therefore create longevity of the parquet.
